Team ID	SWTID-2026-5245
Project Name	OptiCrop – Smart Agricultural Production Optimization Engine
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	**Stage 1: Data Input**	**Stage 2: Get Recommendation**	**Stage 3: Act & Review Outcome**
Actions *What does the customer do?*	• Collects soil sample and gets N. P. K. pH tested • Checks local temperature, humidity and rainfall • Opens the OptiCrop app/website and enters the values	• Submits the form and waits for the model to process • Reviews the recommended crop and confidence score • Reads any additional tips (fertilizer, resource efficiency)	• Selects seeds/inputs based on the recommended crop • Sows the crop and monitors growth over the season • Compares actual yield with expected outcome
Touchpoint *What part of the service do they interact with?*	• OptiCrop input form (web/mobile) • Soil testing kit / local agri office • Weather data source	• ML-based recommendation engine • Results/recommendation screen • Resource-efficiency tips section	• Field and crop • Follow-up notifications or reminders (if any) • Feedback/rating option in the app

Customer Thought *What is the customer thinking?*	• "Am I entering these values correctly?" • "Will this really understand my land?" • "This is quicker than asking around the village."	• "Is this recommendation actually reliable?" • "This matches what I expected – that's reassuring." • "I wonder how this compares to what I usually grow."	• "I hope this crop performs as predicted." • "My yield really did improve this time." • "I'll trust this tool again next season."
Custome r Feeling *What is the customer feeling?*	Slightly unsure, but curious and hopeful	Reassured and confident after seeing a clear recommendation	Satisfied and more trusting of data-driven farming

Process Ownership *Who is in the lead on this?*	Farmer (data entry) supported by local agri extension officer	OptiCrop ML model / backend recommendation engine	Farmer, with the app providing follow-up guidance
Opportuni tie s *How can we improve this stage?*	• Auto-fetch weather data via API to reduce manual entry • Add simple tooltips explaining each soil parameter • Support voice/local-language input for low-literacy users	• Show confidence score and top-3 alternative crops • Explain why the crop was recommended (feature importance) • Allow saving/comparin g past recommendation s	• Send season-end reminders to log actual yield • Use logged outcomes to continuously retrain the model • Offer a feedback loop for farmers to rate accuracy
